Kendall’s coefficient of concordance (aka Kendall’s W) is a measure of agreement among raters defined as follows. Assume there are m raters rating k subjects in rank order from 1 to k. Let r_{ij} = the rating rater j gives to subject i. For each subject i, let R_i = . Let be the mean of the R_i and let R be the squared deviation, i.e. Now define Kendall’s W by

\[ W = \frac{12 \sum_{i=1}^{k} R_i^2 - 3n(n+1)^2}{k(n^2-1)} \]

### Kendall’s Concordance (W) Coefficient | Real Statistics

Kendall’s coefficient of concordance (aka Kendall’s W) is a measure of agreement among raters defined as follows. Definition 1: Assume there are m raters rating k subjects in rank order from 1 to k. Let r_{ij} = the rating rater j gives to subject i. For each subject i, let R_i = . Let be the mean of the R_i and let R be the squared deviation, i.e. Now define Kendall’s W by

\[ W = \frac{12 \sum_{i=1}^{k} R_i^2 - 3n(n+1)^2}{k(n^2-1)} \]
